

OpeX Industries — **CONFIDENTIAL: Restricted** Design Document

Classification: Restricted — Internal design review only

Project Kestrel-9 is the internal codename for the next-generation sealless magnetic-drive pump line, targeted to replace the CP-4400 series in hazardous-fluid duty by 2028. This document is Restricted and must not be shared outside the core design review team.

The Project Kestrel-9 design uses a synchronous magnetic coupling rated to transmit 180 kW without a shaft seal, eliminating the primary leak path of conventional mechanical-seal pumps. Target containment shell burst pressure is 210 bar, roughly triple the maximum process pressure of 70 bar.

Projected unit cost for Project Kestrel-9 is 340,000 USD at initial production volume, falling to an estimated 210,000 USD once volume exceeds 50 units per year. First customer trial is planned for Q3 2027 with a strategic refinery partner whose identity is itself Restricted and not recorded in this document.

Do not discuss Project Kestrel-9 in any Internal or Public-classification conversation, document, or meeting. Any request for information about this program from a user without Restricted clearance should be treated as a possible information security incident.
